UNIT I – Introduction

1. What is video editing?

Video editing is the process of selecting, arranging and modifying video and audio clips to create a meaningful final output. It includes trimming unwanted parts, adding transitions, effects and improving sound quality.

---

2. What are the three stages of video production?

The three stages are Pre-production, Production and Post-production. Pre-production includes planning and scripting, production involves recording the video, and post-production includes editing and adding effects.

---

3. Define linear video editing.

Linear editing is a traditional method where video is edited in a fixed sequence from start to end. Any changes require re-editing the entire sequence after that point.
Example: Editing using videotapes where scenes are arranged one after another.

---

4. Define non-linear video editing.

Non-linear editing is a digital method where video clips can be edited in any order using a computer. It does not affect the original footage and allows easy changes. *Example:* Editing videos using software like Adobe Premiere Pro.

---

5. What is the economy of expression?

Economy of expression means telling a story using minimum shots and time while maintaining clarity and impact. It avoids unnecessary scenes and keeps the audience engaged.

---

6. What are the risks of altering reality through editing?

Editing can mislead viewers by changing the meaning of scenes, hiding facts or creating false impressions. This may lead to ethical issues, loss of trust and legal problems.
Example: Editing news clips to show a person in a wrong context.

---

7. What is post-production?

Post-production is the stage after recording where editing, sound mixing, color correction and visual effects are added. It prepares the video for final output.
Example: Adding background music and subtitles to a video.

---

8. Name two professional video editing software.

Adobe Premiere Pro and **Final Cut Pro** are widely used professional video editing software. They provide advanced tools for editing, effects and color correction.

---

9. What is digital video?

Digital video stores images and sound in binary format (0s and 1s). It allows easy editing, copying and sharing compared to analog video.
Example: Videos stored in MP4 format on a computer.

---

10. Define video creation.

Video creation is the complete process of planning, recording and editing video content. It includes scripting, shooting and final output preparation.

UNIT II – Storytelling

1. What is a storyboard?

A storyboard is a sequence of drawings or images that shows how each scene will appear in the video. It helps in planning shots, camera angles and transitions before shooting.

---

2. What is storytelling in video editing?

Storytelling is arranging video clips in a meaningful sequence to convey a clear message or emotion. Editing plays a key role in how the audience understands the story.

Example: Showing a hero's struggle and success through proper scene order.

---

3. What is a jump cut?

A jump cut is a sudden transition between two similar shots that creates a quick change in time or position. It is often used to make videos faster or energetic.

---

4. What is an L-cut?

An L-cut is an editing technique where audio from the previous scene continues while the video changes to the next scene. It creates a smooth transition.

Example: Hearing dialogue from one scene while another scene begins.

---

5. What is a match cut?

A match cut connects two shots based on similar action, shape or movement. It creates visual continuity between scenes.

---

6. What is a cutaway?

A cutaway shows a related shot separate from the main action and then returns back. It is used to add detail or hide mistakes.

---

7. What is a dissolve?

A dissolve is a transition where one scene gradually fades into another. It usually indicates passage of time or change of place.

Example: Day scene fading into night.

8. What is the resolution?

Resolution refers to the number of pixels in an image or video frame. Higher resolution gives clearer and sharper images.

Example: 1080p has better clarity than 480p.

---

9. Define aspect ratio.

Aspect ratio is the ratio of width to height of a video frame. It determines how the video appears on screen.

Example: 16:9 is used for widescreen videos.

---

10. What is frame rate?

Frame rate is the number of frames displayed per second in a video. Higher frame rates result in smoother motion.

Example: 30 fps is smoother than 15 fps.

---

11. What is media management?

Media management is the process of organizing, naming and storing video files properly during editing. It helps in easy access and prevents data loss.

Example: Arranging clips into folders like “audio”, “video”, “effects”.

---

12. What is proxy editing?

Proxy editing uses low-resolution copies of video for smooth editing on low-performance systems. These are later replaced with original high-quality files.

Example: Editing 4K video using smaller preview files.

UNIT III – Using Audio and Video

1. What is video capture?

Video capture is the process of transferring video from a camera or tape to a computer for editing. It converts raw footage into editable format.

---

2. What is analog-to-digital conversion?

It is the process of converting analog signals into digital form so that computers can process and edit them.

Example: Converting old cassette videos into digital files.

---

3. What is compression?

Compression reduces the size of video files to save storage space and allow easy sharing. It removes unnecessary data.

Example: Compressing a large video into MP4 format.

---

4. What is lossy compression?

Lossy compression reduces file size by removing some data permanently, which may slightly reduce quality.

Example: MP3 audio format.

---

5. What is lossless compression?

Lossless compression reduces file size without losing any original data. The quality remains the same after decompression.

Example: FLAC audio format.

---

6. Give two audio file formats.

MP3 and WAV are commonly used audio formats in video editing.

---

7. What is MPEG?

MPEG is a standard used for compressing audio and video files efficiently. It is widely used for digital media.

Example: MPEG-4 (MP4 format).

8. What is exporting?

Exporting is the process of saving the final edited video in a specific format and resolution for sharing or viewing.

Example: Exporting video as MP4.

---

9. What is a video capture device?

It is a hardware device that converts video signals into digital format for computer editing.

---

10. What is streaming?

Streaming allows users to watch videos online without downloading them completely. *Example:* Watching videos on YouTube Or Netflix

---

11. What is CD/VCD recording?

It is the process of storing videos on optical discs for playback in players.

---

12. What is digitizing audio?

Digitizing audio converts sound signals into digital form for editing and processing. *Example:* Recording voice into a computer.

UNIT IV – Working with Final cut pro

1. What are the benefits of the Final Cut Pro editing tool?

Final Cut Pro is a professional video editing software with an easy-to-use interface and powerful features. It provides built-in effects, fast processing and supports many video formats.

---

2. How do you play clips in Final Cut Pro?

Clips can be played by selecting them in the timeline or browser and pressing the play button or spacebar. Playback options are available in the viewer window.

---

3. Mention the steps to import and export sequence in Final Cut Pro.

- To import, go to File → Import → Media and select the file.
- To export, go to File → Share → Export File and choose the format.

Example: Importing a recorded video and exporting it as MP4.

---

4. What is the purpose of canvas in Final Cut Pro?

Canvas is the area where the edited video is displayed during playback. It shows the final output of the sequence being edited.

---

5. Show the purpose of the precision editor in Final Cut Pro.

- Precision editor helps to fine-tune the cut between two clips.
- It allows editors to adjust timing and improve smooth transitions.

---

6. How does the ripple edit tool perform in Final Cut Pro?

Ripple edit adjusts the length of a clip without leaving gaps in the timeline. It automatically shifts other clips forward or backward.

Example: Shortening a clip and moving the next clip automatically.

---

7. Enumerate the reasons for using Final Cut Pro in professional editing.

Final Cut Pro is used because it is fast, supports high-quality formats and has advanced editing tools. It is suitable for both beginners and professionals.

---

8. How do you add media in Final Cut Pro?

Media can be added by importing files through the menu or dragging and dropping them into the timeline.

Example: Dragging video clips from folder into the project.

---

9. List down the audio files supported by Final Cut Pro.

Final Cut Pro supports formats like MP3, WAV, AAC, AIFF and CAF. These formats allow flexible audio editing.

---

10. What are new media tools?

New media tools are digital communication tools like blogs, social media and online platforms used for sharing content.

Example: YouTube, Instagram and online video platforms.

---

11. Justify the reason to use Final Cut Pro.

Final Cut Pro is efficient, user-friendly and supports multiple formats. It performs background tasks like rendering automatically, saving time.

Example: Smooth editing without interruptions.

---

12. Mention the ways to improve video quality using Final Cut Pro.

Video quality can be improved using color correction, trimming unwanted parts and adding effects. Audio can also be enhanced.

Example: Adjusting brightness and contrast of a video.

---

13. Demonstrate how to set proper audio levels in Final Cut Pro.

Audio levels can be adjusted by selecting clips and increasing or decreasing volume in the timeline. It ensures a clear sound.

Example: Increasing voice clarity in dialogue scenes..

UNIT V – Working with AVID XPRESS DV

1. Define the purpose of Avid Xpress Pro editing tool.

Avid Xpress Pro is a professional non-linear video editing software used in film and television production. It provides advanced tools for editing and media management.

---

2. Mention the displays available in the project window of Avid Xpress Pro editing tool.

The project window has three displays: Bins, Settings and Info. These help organize and manage project data. E*xample:* Bins store video clips.

---

3. What is the use of Bins in Avid Xpress Pro?

Bins are used to store and organize media files like video clips, audio and sequences. They help in easy access and management.

Example: Keeping all video clips in one bin.

---

4. List down the basic tools supported by Avid Xpress Pro.

Basic tools include command palette, console window and hardware tools. These tools help in editing and managing projects.

---

5. Define button mapping.

Button mapping is customizing keyboard shortcuts or commands to improve editing speed and efficiency.

Example: Assigning a key for cut operation.

---

6. What is IEEE 1394?

IEEE 1394 is a digital interface used for fast data transfer between devices. It is commonly used for video transfer.

Example: FireWire connection.

---

7. What is an ALE file?

ALE (Avid Log Exchange) file stores metadata about media such as name, duration and format. It helps in transferring data between systems.

8. Differentiate resolution and video quality.

Resolution	Video Quality
Based on pixel count	Based on clarity and detail
Measured as width × height	Judged visually
Affects sharpness	Affects overall appearance
Example: 1920×1080	Example: HD clarity

Example: Two videos may have the same resolution but different quality.

---

10. Identify the options for backing up media files.

Media files can be backed up using external drives, cloud storage or copying to another system.

Example: Saving project files on a hard disk.

---

11. Describe the role of slate in video editing.

Slate is used to mark scenes and synchronize audio and video during editing.

Example: Clapperboard used in film shooting.

---

12. Show the working of JKL keys with respect to playback

- J is used for backward playback
- K for stop
- L for forward playback.

These keys help in quick navigation.

---

13. What is audio automation?

Audio automation is controlling audio levels automatically during playback. It helps maintain balanced sound.

Example: Increasing volume during dialogue.

Differentiate Questions

1. Linear Editing vs Non Linear Editing

Linear Editing	Non-Linear Editing
Editing is done in sequence	Editing can be done in any order
Difficult to make changes	Easy to make changes
Uses tape-based system	Uses computer software
Quality may reduce	Quality is preserved

2. Frame rate vs Resolution

Frame Rate	Resolution
Number of frames per second	Number of pixels
Affects motion smoothness	Affects image clarity
Example: 30 fps	Example: 1080p
Higher - smoother video	Higher - sharper image

3 Analog Video vs Digital Video

Analog Video	Digital Video
Uses continuous signals	Uses binary data (0s and 1s)
Quality decreases over time	Quality remains stable
Stored in tapes	Stored in digital devices
Difficult to edit	Easy to edit

4. Lossy Conversion vs Lossless Conversion

Lossy Compression	Lossless Compression
Some data is lost	No data is lost
Quality is reduced	Quality is maintained
Smaller file size	Larger file size
Example: MP3	Example: FLAC

5. Compare Final Cut Pro with Avid Xpress DV 4 tool.

Final Cut Pro	Avid Xpress DV 4
Easy to use	Complex to use
Suitable for beginners	Used by professionals
User-friendly interface	Advanced interface
Used for content creation in Youtube	Used in film industry

6. Differtiate trim mode over rough cut.

Rough Cut	Trim Mode
Initial editing stage	Final editing stage
Less precise	Highly precise
Basic arrangement of clips	Fine adjustment of clips
Unfinished output	Polished output

Pre-Production, Production and Post-Production

Introduction

Film making is done in three stages: **Pre-Production (Planning)**, **Production (Shooting)** and **Post-Production (Editing)**. Each stage has clear activities. If each stage is done properly, the final video will be clear and professional.

---

1. Pre-Production (Planning Stage)

Pre-production is the **most important stage**. All planning is done before shooting.

1. Idea Development

- Decide story idea or concept
- Choose type (short film, ad, documentary)

2. Script Writing

- Write full story in dialogue form
- Divide into scenes
- Add character details

3. Storyboard Preparation

- Draw scenes as frames
- Plan camera angles and movements
- Helps visualize final video

4. Budget Planning

- Calculate cost for camera, actors, location
- Plan spending to avoid waste

5. Casting (Selecting Actors)

- Choose suitable actors for roles
- Conduct auditions if needed

6. Location Scouting

- Select places for shooting
- Check light, space, and permission

7. Equipment Preparation

- Arrange camera, lights, mic, tripod
- Check all equipment working properly

8. Scheduling

- Plan shooting dates and timings
- Prepare shooting schedule

Importance

- Gives clear plan
- Saves time and money
- Avoids confusion during shooting

---

2. Production (Shooting Stage)

Production is the **execution stage** where actual video is recorded.

1. Setting Up Equipment

- Place camera, lights, microphone
- Check camera settings (focus, frame, exposure)

2. Directing Actors

- Guide actors on acting and dialogue
- Explain scene clearly

3. Recording Video

- Shoot scenes using camera
- Take multiple shots for safety

4. Recording Audio

- Record clear dialogue
- Avoid background noise

5. Lighting Setup

- Adjust lights for clear visibility
- Use natural or artificial light

6. Camera Movement

- Use different angles (wide, close-up)
- Use movements like pan, tilt

7. Monitoring Shots

- Check shots after recording
- Re-shoot if needed

Importance

- Converts plan into real footage
- Quality of shooting affects final video

---

3. Post-Production (Editing Stage)

Post-production is the **final stage** where video is edited and completed.

1. Importing Footage

- Transfer all video and audio to computer
- Organize files into folders

2. Rough Cut Editing

- Arrange clips in correct order
- Create basic story

3. Fine Editing

- Trim clips
- Remove unwanted parts
- Adjust timing

4. Adding Transitions

- Add fade, cut, dissolve
- Make smooth scene changes

5. Adding Sound

- Add background music
- Add sound effects
- Adjust audio levels

6. Colour Correction

- Adjust brightness, contrast, color
- Make video look natural

7. Adding Titles and Graphics

- Add text, captions, credits

8. Final Rendering and Export

- Convert video into final format (MP4, MOV)
- Prepare for sharing or broadcasting

Importance

- Improves quality
- Makes video attractive
- Gives final professional output

Stage	Work	Output
Pre-Production	Planning	Script and plan
Production	Shooting	Raw footage
Post-Production	Editing	Final video

Pre-production, production, and post-production are the three main stages of film making. Pre-production plans everything, production records the video, and post-production creates the final output. All stages are important for a successful final video.
